

Afterhours chatbot -Lead Assistant									
Task ID	Phase 1— After-Hours AI Lead Assistant All tasks across database, n8n workflow, Supabase integration, auth, and dashboard UI	Purpose	Status	Priority	What Was Completed	What Was Not Completed	Blockers	Target Date	Notes
1.1	Data Base Foundation								
	Create 5-table schema with RLS	practices, chats, messages, leads, admins — with RLS enabled and practice_id-based SELECT policies. Foundation everything else reads and writes.	Completed						
	Create seed SQL (template)	Practice INSERT with placeholder tokens + admin row INSERT template linking auth UUID to practice_id. Lets user run real data without editing schema files.	Completed						
	Run schema + seed in Supabase dashboard	User creates Supabase project, runs schema.sql, fills in practice data, creates auth user, runs seed.sql. Cannot be automated — requires dashboard access.	Partially Done						
	n8n workflow and Supabase Integretion								
	Set up n8n Supabase credentials	Add Supabase project URL and service role key to n8n credentials. Required before any Supabase node can read or write data.	Completed						
	Build AI Agent node with OpenAI + Pinecone	AI Agent with Memory, Pinecone vector store tool (Answer questions), and OpenAI chat model. Core intelligence of the assistant.	Completed						
	Build Code in JavaScript node	Parses AI agent output into structured fields: chat_id, practice_id, patient_message, ai_response, response_type, is_emergency, lead_captured, lead_name, lead_phone, lead_email, trigger_question.	Completed						
	Build Get + IF + Upsert logic for chats table	Get node checks if session row exists → IF node branches → Update existing row (true) or Create new row (false). Prevents duplicate key errors on follow-up messages.	Completed						
	Build messages table insert node	Create a row in the messages table for every message exchange — stores role, content, response_type, chat_id, and created_at per message.	Completed						
	Build lead capture IF + leads table insert	IF node checks response_type = "lead_capture" → true branch inserts row into leads table with name, phone, email, trigger_question, chat_id, practice_id.	Completed						
	Update chats.lead_captured flag	When lead is captured, update chats table lead_captured = true so the dashboard can filter and report on sessions that produced a lead.	Completed						
	End-to-end workflow test - Testing is recurring. It is performed after each update to workflows or DB for now.	Send hi → ask question → provide name and number. Verify chats row created, messages rows created, leads row created, lead_captured = true in chats.	In progress						
	Next.js project Scaffold								
	Scaffold Next.js app with Supabase packages	create-next-app with TypeScript, Tailwind, App Router, src/ dir. Install @supabase/supabase-js and @supabase/ssr. Create .env.example template.	Completed						
	Create Supabase server + browser clients	src/lib/supabase/server.ts (cookie-based SSR client) and client.ts (browser client). Used by all server components and client components to query Supabase.	Completed						
	Create proxy.ts auth guard	Middleware at repo root. Validates JWT via getClaims(), redirects unauthenticated users from /admin/* to /admin/login. Single enforcement point for route protection.	Partially Done						
	Admin Auth Flow								
	Login page + server action	Centered card login form with email/password. Server action calls signInWithPassword, redirects to /admin/leads on success or shows error on failure.	Completed						
	Logout server action	signOut() clears session, revalidates layout cache, redirects to /admin/login. Called from sidebar logout button via formAction.	Completed						
	Admin layout with auth guard + sidebar	Server component calls getUser() for defense-in-depth check. Renders sidebar shell with practice name, Leads nav, logout button. Skips shell for /admin/login route.	In progress						
	Verify complete auth flow in browser	Manual check: redirect to login when unauthenticated, error on wrong credentials, successful login lands on /admin/leads, logout clears session.	Completed						
	Leads Dashboard UI								
	Leads page	table shell with 5 columns (Name, Phone, Email, Trigger Question, Date) and "No leads yet" empty state. Shows the frame before real data flows in.	Completed						
	Wire leads page to Supabase leads table	Server component queries leads table filtered by practice_id from admin session. Real leads from n8n workflow appear in the dashboard without manual refresh.	Not Started						
	UI Enhancements								
	Login page polish	Practice logo/name above the card, loading spinner on submit, password show/hide toggle, input focus states, smooth error banner fade-in animation.	In progress						
	Leads table search + date filter - Optional	Search input filters by name, phone, or email. Date range picker filters leads by captured_at. Helps admin find specific leads quickly as the table grows.	Not Started						
	Chat widget UX polish	Typing indicator (animated dots), message timestamps, smooth open/close animation, mobile-responsive layout, branding colors pulled from practice record, accessible keyboard nav.	Not Started
